TuBaRo

12 volt precise granular material spreader

**Do you have to spread material behind a little roller????
We have the solution for you !!!!**

Problem:

Before, with small rollers it was not possible to spread sand or gravel using a machine.

Solution:

With the TuBaRo you can spread granular material of almost any grain size using a machine with extreme precision, without any problem.

Advantages:

Unlike a disk spreader, the TuBaRo spreads material in an absolutely uniform manner. For physical reasons, the disk spreader makes the larger grain size particles fly to the outside and thus the finest parts fall in the centre and the larger ones to the outside. The wind has little effect with respect to a disk spreader. In motorway construction it is already partially forbidden to use disk spreaders to spread material.

Operating width

The TuBaRo can be modified in a second from 80 cm to 1.20 m.

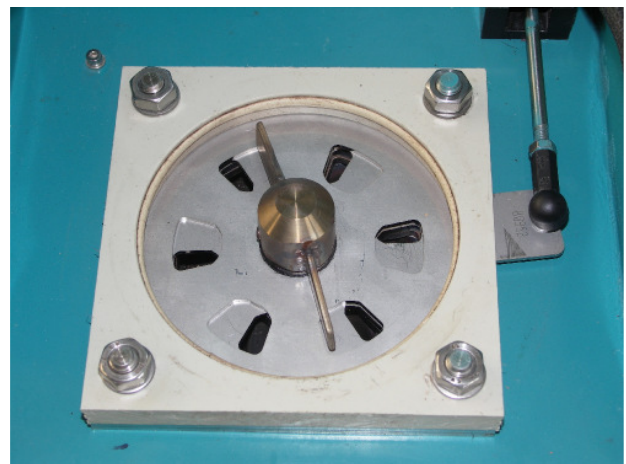

Use

It is operated directly from the driving seat from a modern control panel. Any failures are indicated with a visual and acoustic warning signal.

Dosage:

The quantity to spread can be modified during operation from the control panel. According to the material, it is possible to spread up to 45 kg/min. The gate valve with its controlled position guarantees that even quantities are spread.
